

Taskora Final QA Defect Report — Sprints 1–4

Defects

Sprint 1

1. When adding a new member you can add your own account as a different team member
2. When adding another new member it overwrites the other member
3. When pressing assigned task it always goes to the top project even when there are multiple other projects

Sprint 2

1. Inviting an unregistered email is accepted without any error
2. Can't remove or clear the email field when making a workspace
3. Can't revoke a shareable invite link once it's been generated
4. Refresh token expires too quickly (currently set to 15 minutes)
5. No option to update a task — edit button is missing from the UI

Sprint 3

1. Notification panel renders behind other content instead of on top
2. Verification status is inconsistent between the task page and assigned task view
3. End date can be set before the start date
4. Task can be created without a start or due date
5. Members cannot leave a workspace after joining
6. No option to unverify a verified task

Sprint 4

1. An account can be registered with a username that already exists

Severity

Sprint 1

1. High
2. Critical
3. Medium

Sprint 2

1. Medium
2. Low
3. Medium
4. Low
5. High

Sprint 3

1. Medium
2. High
3. Critical
4. Critical
5. High
6. High

Sprint 4

1. Medium

Fixes

Sprint 1

1. Add a validation that checks if the email matches the logged-in user's account, then show a message telling them they can't add themselves
2. Implement a join table to properly support multiple members per workspace
3. Make sure every task stores its own projectId so navigation routes to the correct project

Sprint 2

1. In workspace.service.ts, update the inviteByEmail function to check if the user exists before adding them — return a 404 error if not found
2. Add a clear/remove button next to the email input field in the create workspace form
3. Add a DELETE /workspaces/:id/invite endpoint that invalidates the current token — store a hash of the token in the database so it can be marked as revoked
4. Increase JWT_REFRESH_EXPIRY and REFRESH_TOKEN_TTL to 7 days in .env and auth.controller.ts
5. Add an edit button on the task page that opens a pre-filled form and calls the existing PATCH /workspaces/:id/tasks/:taskId endpoint

Sprint 3

1. Apply a high z-index (e.g. 9999) to the notification panel and use position fixed or absolute so it sits outside any clipping parent
2. Make sure both the task page and assigned task view read from the same API endpoint or shared state — any verification change should trigger a refresh in all relevant views
3. Add both client-side and server-side validation — the date picker minimum should be set dynamically to the current start date, and the backend should reject submissions where due date is earlier than start date
4. Mark both date fields as required with clear form indicators — if undated tasks need to be supported, make it an explicit opt-in toggle
5. Add a Leave Workspace option in workspace settings with a confirmation step — if the leaving member is the only admin, prompt an ownership transfer first
6. Add an Unverify button for users with the right permissions, with a confirmation dialog — a verification history log showing who changed the status and when would also help

Sprint 4

1. In `auth.service.ts`, update the `register` function to check if the name already exists before creating the user — the `userExistsByEmail` check is already in place, just add a similar `userExistsByName` check in `user.repository.ts` and throw a 409 error if a match is found

Test Coverage Gaps

The following areas had little or no test coverage across the three sprints:

- Date range validation (start before end, required date fields)
- Boundary testing on authentication flows (self-invite, email existence check on invite)
- Cross-view state consistency for task verification
- Invite token revocation
- Member leave and workspace ownership edge cases
- UI rendering across different layout breakpoints (notification z-index issue)

Summary

Total defects logged: 15

Critical: 3 | High: 5 | Medium: 5 | Low: 2

Resolved: 14 | Open: 1

14 of the 15 defects logged across Sprints 1–3 have been resolved. The one remaining open defect is the duplicate username issue found in Sprint 4, which requires a uniqueness check to be added to the registration flow in `auth.service.ts` and `user.repository.ts`.
